## **Abstract**

My own moral stratification model of neurotechnology explains the conclusion that between 2022 and 2024, American netizens contacted online supported my patriotism in reform and opening up under the public safety of neurotechnology at that time, in order to stabilize the situation in Asia and ensure that the risk of war in the Taiwan Strait is not intensified due to social and emotional pressure caused by neurotechnology.

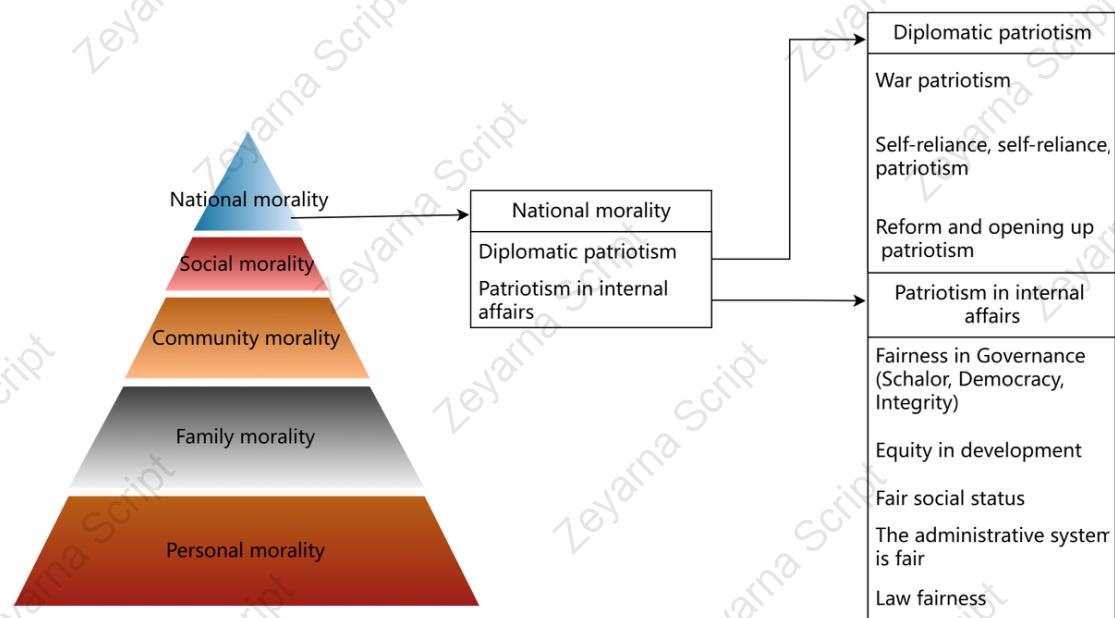

## **Preface**

From an academic perspective, I reviewed the contact and cooperation with American netizens from 2022 to 2024, and found that I had a serious

underestimation of the risk of public harm to neurotechnology at that time, and I greatly admired and thanked the United States for its contribution to this matter. This article is short, mainly because too many details may be exposed when editing neurotechnology, and I still have personal interference and injuries in the hard life in the countryside, so I will enrich and improve it in time after the brain is protected, and I hope for your understanding.

At present, I believe that the high-level dialogue between China and the United States has been held at the head of state dialogue, and this article can effectively promote Sino-US friendship, and I will provide this article to the world as soon as possible after my car accident yesterday, so as to support the relevant Sino-US friendship from an academic perspective. (September 20, 2025)

## 1. My previous neurotechnical moral stratification model

When war patriotism, which is the highest point of public morality under neurotechnology, emerges, public morality will theoretically be at its peak. The most likely event for this level of public morality to emerge in China is the Taiwan Strait crisis. At the same time, the situation on the Korean Peninsula and the ongoing Russia-Ukraine war are both risks of more intense and longer international wars and existing wars around China, which will be intensified by the moral hazard generated by neurotechnology public propaganda.

## **2.The possibility of war between China and the United States from 2022 to the present**

Since 2022, China's large-scale exercises in the Taiwan Strait have not been terminated since 2022 due to the Taiwan Strait crisis caused by Taiwan's unconstitutional independence, and civil war sentiment is high.

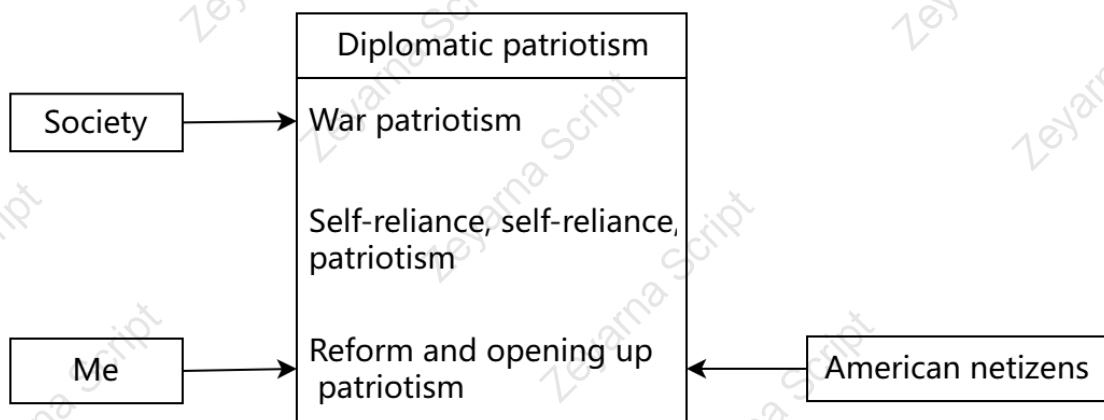

In 2022, large-scale commemoration of the War to Resist US Aggression and Aid Korea began, resulting in neurotechnology, public morality, and political incitement to speculation, leading to a rise in war sentiment on the Korean Peninsula caused by neurotechnology.

The Russia-Ukraine war, which began to intensify in 2022, has further led to the confrontation between China and the United States, as well as the risk of war in the Taiwan Strait and the Korean Peninsula.

## **3.The injustice of the absolute international consensus on neurotechnology**

As a public area propaganda, as well as inherently inhumane and anti-democratic characteristics, in the case of publicly proposing a faith-level neurotechnology governance consensus and world peace in 2022, that is, in the case of reform and opening up patriotism, the only way to defeat myself and control the government at the level of public morality is to upgrade moral propositions, and at the same time, with the help of the dangerous international situation at that time, it will inevitably exacerbate the risk of war in the Taiwan Strait on unjust grounds.

## 4. The only way to restrain the highest level of public war emotions

The United States is a party that inevitably participates in the war with Taiwan under the Joint Defense Act. Active contact at this time, and the corresponding low posture of open approach with faith tolerance, is the only way to reduce the risk of unjust wars caused by neurotechnology when strategic decisions of national interests cannot be avoided and controlled. It will also be naturally attacked by the Taiwan government and the mainland people who do not know the truth.

## 5. Conclusion

The active engagement of US military personnel from 2022 to the present is essentially a positive contribution from the perspectives of international strategy, world justice and peace, and peace of faith. Neurotechnology
